

## How to read it

The year runs clockwise, starting with January at the top. Find a day on the outer calendar and read inward along its spoke.

In the 24-hour day ring, each day runs from midnight on the inner edge, through noon in the middle, to midnight on the outer edge, so the yellow daylight band is wide in summer and narrow in winter. Its jumps in April and October are daylight saving time.

The warmest days come about a month after the longest days, as land and air take time to warm up.

Rain here is so heavy in the wettest weeks, up to 0.47 inches a day on average, that it rises past its own ring into the temperature ring.

## Legend

- Daylight
- Twilight (dawn and dusk)
- Night
- Moon in the sky (by day, by night)

New · First quarter · Full · Last quarter

- Average high temperature
- Average low temperature
- Average rain and snow per day (inches of water)

## Seasons 2027

dashed lines on the chart

| | |
|---|---|
| Autumn equinox | March 21, 7:24 am |
| Winter solstice | June 22, 12:10 am |
| Spring equinox | September 23, 4:01 pm |
| Summer solstice | December 22, 1:42 pm |

Sun and Moon are calculated for this location, in local clock time. Temperature and precipitation are WMO 1991–2020 climate normals (30-year averages) for weather station 0-36-9-94783, smoothed from monthly to daily values.
